

POST COVID SCENARIO AND FUTURE CHALLENGES

Shilpita Chakravorty
Bsc Economics Hons. Semester-2

The year 2020 might have started with a jovial mood but just a month or two down the line the world seemed to be gearing up against an unknown, unseen, unheard enemy – COVID-19 virus. This minute creature led to the world's biggest shutdowns ever, causing this busy world to come to a standstill. However as things are progressing people are trying to get back to their normal lives but the exact time when we get rid of this disease is still unknown.

What is needed coming out of the COVID-19 crisis is a model that addresses the structural roots of this crisis. Most importantly, models of recovery need to clearly articulate how they will fundamentally redefine our economies' relationship with nature. The world was already risking a planetary health crisis due to degraded air, land, water quality which would have caused a wide spread effect but instead the problem of covid appeared. This can be also seen as a reaction of nature towards the use and misuse of her resources. Due to this lockdown, there have been events of return of organisms which were thought to be extinct in their respective habitats.

It is expected that these organisms will definitely return back with full might if the situation persists. The quality of air, water, and land is also increasing. One of the things that government should do is take more actions in case of protection of flora and fauna. The other being better health care facilities across the world with respect to medicines and services provided. Post COVID it is very evident that all the factories that were shut all this while will open and start functioning once again and hence producing pollutants. But this time it is the responsibility of the government and the people to stop the emission of the various pollutants. This is going to be a big challenge in future. Just like there are two sides of a story similarly post covid will have a positive and a negative side. However it is the responsibility of the government in general and the people specifically to maintain a balance between both the conditions. The government can implement laws in the interest of people but it is only upon the people across the globe to work towards better functioning of those laws in order to make this world a stable and burgeoning place .
